UPS Expansion	<p>Our current UPS system is approaching uncomfortable levels of usage. The existing UPS is a 16kVA unit, with a current draw of approximately 12kVA. Moreover, it represents a single point of failure within our data center.</p> <p>I recommend that we install an 8kVA unit to complement the larger 16kVA unit. Additionally, when it comes time to replace the 16kVA unit, I propose replacing it with two smaller units instead of a single large one. This configuration will provide redundancy and overlap, with a total of three 8kVA units in place.</p>	DW20-157	26,459	3/2/2021	\$ 15,000	Yes	Nashua	No	\$ 23.26	\$ -
Upgrade for the phone system	<p>The current phone system is running on Cisco version 12.5. However, please note that this software is no longer available for purchase as of August 31st, 2023. The last day of support for this current version will be August 31st, 2025. I strongly recommend that we update to the latest version of Cisco Call Manager.</p> <p>During this update, we plan to relocate one of the server nodes to the distribution center to ensure redundancy for that side of town in case of a failure in the dark fiber link between DW and HQ. The associated costs will primarily consist of professional services provided by an external vendor.</p>	DW20-157	26,459	3/2/2021	\$ 25,000	Yes	Nashua	No	\$ 23.26	\$ -

Replacement for disk array	Our core disk array, an HPE Nimble installed in 2018, has reached the industry-standard life expectancy for production loads of approximately five years. We are currently out of the manufacturer's warranty and under a third-party warranty that only covers parts. While the storage performance has met our needs, it is essential to address the aging hardware and risks it brings. • Aging Hardware: Our HPE Nimble hybrid flash array, which has been in service since 2018, is approaching the industry-standard life expectancy of five years for production loads. • Warranty Status: We are currently operating without manufacturer warranty coverage and relying on a third-party warranty that only covers parts. This leaves us vulnerable to potential downtime and increased repair costs in case of component failures. • Storage Performance: While our current array has effectively met our storage performance needs, the evolving demands of our organization, including the need for faster data access and application responsiveness as we scale our operations, must be considered. • Cost-Efficiency: Despite the initial cost-effectiveness of our existing array, we need to weigh this against the escalating risks and costs associated with aging hardware, including maintenance, repair, and downtime costs. Benefits of Upgrading: • Performance Improvement: An all-flash array offers significantly faster data access times, leading to improved application responsiveness and overall productivity. • Enhanced Reliability: Flash storage's lack of mechanical parts reduces the risk of disk failures and associated downtime, ensuring higher system reliability. • Cost Savings: While the upfront cost is higher, all-flash arrays have a lower total cost of ownership (TCO) over time due to reduced maintenance and energy consumption. Cameras at the River intake	We have received a request to establish camera coverage at the river intake site. We have already begun the process of installing internet connectivity at this location through Comcast. We anticipate the construction work to be finished by early 2024. Once the construction is completed, our plan is to install cameras, networking infrastructure, firewalls, and switches to accommodate the camera system requirements.
