

**STATE OF NEW HAMPSHIRE  
BEFORE THE  
PUBLIC UTILITIES COMMISSION**

Public Service Company of New Hampshire)  
Petition for Approval of Integrated Least )  
Cost Resource Plan )

Docket No. DE07-108

**REDACTED**

**DIRECT TESTIMONY  
OF  
GEORGE R. McCLUSKEY**

June 6, 2008

1 **I. INTRODUCTION**

2 Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

3 A. My name is George McCluskey, and my business address is the New Hampshire  
4 Public Utilities Commission (“Commission”), 21 South Fruit Street, Suite 10,  
5 Concord, NH 03301.

6 Q. WHAT IS YOUR POSITION WITH THE COMMISSION?

7 A. I am an analyst within the Electric Division.

8 Q. PLEASE DESCRIBE YOUR BACKGROUND AND EXPERIENCE.

9 A. I am a utility ratemaking specialist with over 20 years experience in utility economics. I  
10 rejoined the Commission in March 2005 after working as a consultant for La Capra  
11 Associates for five years. Before joining La Capra, I directed the Commission’s electric  
12 utility restructuring division and before that was manager of least cost planning, directing  
13 and supervising the review and implementation of electric utility least cost plans and  
14 demand-side management programs. I have presented or filed testimony before state  
15 regulatory authorities in New Hampshire, Maine, Ohio and Arkansas and before the  
16 Federal Energy Regulatory Commission. A copy of my resume is included as Exhibit  
17 GRM-1.

18 Q. PLEASE STATE THE PURPOSE OF YOUR TESTIMONY.

19 A. The purpose of my testimony is to present Staff’s comments on Public Service  
20 Company of New Hampshire’s (“PSNH” or “Company”) resource planning as  
21 described in its September 30, 2007 Least Cost Integrated Resource Plan  
22 (“LCIRP”) and the supplements filed March 28, 2008.

23

24

1 Q. HOW IS YOUR TESTIMONY ORGANIZED?

2 A. I begin in Section II by reviewing the standards for Commission review and  
3 approval of electric utility LCIRP filings. In Section III, I comment on the  
4 Company's demand-side assessment and in particular the proposal to fill a portion  
5 of the projected resource balance with an expansion of the Core Energy  
6 Efficiency programs. This is followed in Section IV with my comments on the  
7 package of supply-side resources that the Company believes would best meet  
8 customer demands over the planning horizon if it had the legal authority to  
9 acquire such resources. I also address in Section IV whether a continued unit  
10 operation study of Merrimack Station should be conducted before a final  
11 commitment to the installation of costly scrubber technology is made.

12 Q. BEFORE YOU BEGIN YOUR DISCUSSION OF THE STANDARD FOR  
13 REVIEW OF LEAST COST INTEGRATED RESOURCE PLANS, PLEASE  
14 SUMMARIZE STAFF'S CONCLUSIONS.

15 A. Staff's conclusions are summarized as follows:

16 (1) PSNH did not perform an assessment of the potential for demand-side  
17 resources in its service territory. Nonetheless, information on the technical  
18 and economic potential of demand-side resources for New Hampshire should  
19 become available later this year when the consultant hired in response to the  
20 Commission's energy efficiency RFP submits its report.

1 (2) PSNH's conclusion that an ISO-NE administered demand response  
2 program should not be implemented at this time is not supported by the  
3 Company's own analysis, which understates the customer benefits.

4 (3) The benefits adder for environmental externalities included in the cost  
5 effectiveness test for demand-side resources should be removed.

6 (4) The generic cost information provided by PSNH relating to the  
7 construction or acquisition of new generation options is deficient in several  
8 important respects. First, the revenue requirements estimates for the wind and  
9 biomass options leave out the cost of transmission. Second, the revenue  
10 requirements estimates for the biomass and peaking plants do not include the  
11 cost of land or reflect the need for capital additions. Third, the cost of fuel for  
12 the biomass and peaking plants is assumed unrealistically to decline in real  
13 terms over the plant lives. Fourth, even though the federal Business Energy  
14 Tax Credit is due to expire at the end of 2008, and is not currently available to  
15 public utilities, the tax credit was included in the revenue requirements for  
16 solar PV. Fifth, the method used to rank the new generation options is flawed.  
17 Based on these conclusions, Staff argues that the generic cost information  
18 does not support giving PSNH the authority to construct or acquire new  
19 generation capacity.

20 (5) PSNH should conduct an analysis to determine whether continued  
21 operation of the Merrimack Station is economic relative to market purchases  
22 when the costs of installing and operating the scrubber are taken into account.

1 (6) PSNH should conduct an analysis to determine whether continued  
2 operation of the Newington Station is economic relative to market purchases  
3 based on fuel costs that are reflective of current forward prices.

4 **II. STATUTORY REQUIREMENTS**

5 Q. WHAT STANDARDS HAVE YOU APPLIED IN ASSESSING WHETHER  
6 THE COMPANY'S LCIRP IS ADEQUATE?

7 A. The starting point for any discussion of the adequacy of an electric utility's  
8 LCIRP must be RSA 378:38, New Hampshire's least cost energy planning statute.  
9 This statute specifies that each LCIRP must include at a minimum the following  
10 reports:

- 11 1. A forecast of future electrical demand for the utility's service area;
- 12 2. An assessment of the demand-side energy management programs,  
13 including conservation, efficiency improvement, and load management  
14 programs;
- 15 3. An assessment of supply-side options;
- 16 4. An assessment of transmission requirements;
- 17 5. Provision of diversity of supply sources;
- 18 6. Integration of demand-side and supply-side options;
- 19 7. An assessment of plan integration and impact on state compliance with  
20 the Clean Air Act Amendments of 1990;
- 21 8. An assessment of plan integration and impact on state compliance with  
22 the National Energy Policy Act of 1992<sup>1</sup>;

---

<sup>1</sup> I would assume that this report would relate to the recent amendments to the 1992 Act.

1                   9. An assessment of the plan's long- and short-term environmental,  
2                   economic and energy price and supply impact on the state.

3 Q.    HAS THE COMMISSION PROVIDED ANY GUIDANCE ON THE CONTENT  
4    OF THE ABOVE REPORTS?

5 A    Yes it has. Most recently in Order No. 24,695 the Commission approved a partial  
6    settlement agreement in Docket DE 04-072, PSNH 2004 LCIRP, which resolved  
7    some of the filing requirement issues that had arisen during the course of the  
8    proceeding. In addition, the Commission resolved several issues where the  
9    parties failed to reach agreement. Since all of these issues have implications for  
10   the current proceeding, I present brief summaries of each starting with those on  
11   which agreement was reached:

- 12                   (1) The planning period for PSNH's 2007 LCIRP will be as long as the  
13                   single longest lead time for generation resource options, but in no  
14                   event shorter than five years;
- 15                   (2) The report on load forecasts for delivery and energy services will  
16                   address the specific issues identified in the order;
- 17                   (3) Energy and capacity resource balances will be identified;
- 18                   (4) Reasonably available supply-side resource options to meet the  
19                   projected resource balance will be identified and an assessment of  
20                   base-load, intermediate and peaking needs provided;
- 21                   (5) A long-term wholesale price forecast will be provided;
- 22                   (6) The coal procurement strategy will be described including efforts to  
23                   reduce coal transportation costs;
- 24                   (7) The impact of anticipated changes in fuel procurement regulations will  
25                   be discussed along with the impact those changes are likely to have on  
26                   the cost of fossil-fired generation;
- 27                   (8) A description of the hedging strategy will be provided;
- 28                   (9) Reasonably available alternatives to the existing strategy for meeting  
29                   SO2 regulations will be described and evaluated. In addition, the SO2  
30                   compliance plan will be described and its impact on retail rates  
31                   quantified;
- 32                   (10) Reasonably achievable production adaptations, market-based  
33                   mechanisms or other alternatives that could be used to comply with  
34                   Phases I and II of New Hampshire's Clean Power Act or proposed  
35                   regional or federal programs to decrease power sector CO2 emissions

1 will be described. In addition, the potential rate impact of any  
2 compliance plan will be quantified;

3 (11) Alternatives for complying with potential state and federal mercury  
4 emissions regulations will be described. In addition, the mercury  
5 emissions compliance plan will be discussed and its potential rate  
6 impacts quantified;

7 (12) The process for integrating demand-side and supply-side resources at  
8 the lowest reasonable cost will be described.  
9

10 The disputed issues were decided as follows:  
11

12 (1) The Company's request for a waiver of the requirement in RSA 378:38  
13 that electric utilities address generation in their LCIRPs is denied;

14 (2) Generic cost information on the construction or acquisition of  
15 reasonably available new generation options will be provided;

16 (3) Supply-side resource options will be evaluated based on net present  
17 value of revenue requirements. The options will be ranked from lowest  
18 net present value relative to the cost of market purchases to the  
19 highest;

20 (4) In evaluating supply-side options, the following criteria will also be  
21 taken into account: (i) environmental compliance costs; (ii) fuel  
22 diversity; (iii) availability at the time of system peak; and (iv) the  
23 ability to promote price stability;

24 (5) The Company is not required to evaluate the costs and benefits of  
25 divestiture in the context of an LCIRP;

26 (6) The Company is directed to include in its next LCIRP: (i) a systematic  
27 evaluation of reasonably available DSM programs; (ii) a description of  
28 the avoided cost methodology that forms the basis of that evaluation;  
29 and (iii) the resulting avoided cost forecast.

30 (7) The Company will undertake a study to determine the effects of using  
31 the Rate Impact Method test on demand side management resource  
32 availability.  
33

34 Q. DOES THE LCIRP COMPLY WITH THE REQUIREMENTS OF ORDER NO.  
35 24,695?

36 A. Not completely.

1 **III. ASSESSMENT OF DEMAND-SIDE PROGRAMS**

2 Q. PLEASE PROVIDE A BRIEF SUMMARY OF THE COMPANY’S DEMAND-  
3 SIDE MANAGEMENT ASSESSMENT.

4 A. In order to determine whether a portion of the projected capacity and energy  
5 shortfall could be met at least cost with an expanded program of demand-side  
6 resources, the Company claims that it examined whether sufficient cost-effective  
7 demand-side resources are available to support such an expanded program.<sup>2</sup> The  
8 Company then analyzed how much of this potential could be realized by  
9 increasing the size of the Core Energy Efficiency programs. Three funding levels  
10 were considered:

- 11 • 25% increase in the EE portion of the SBC to 2.25 mills per kWh
- 12 • 50% increase in the EE portion of the SBC to 2.7 mills per kWh
- 13 • 67% increase in the EE portion of the SBC to 3 mills per kWh

14 The Company calculated, for example, that a 50% increase in funding would  
15 reduce peak demand by 26 MW by 2012 and save 97,000 MWh.

16 Q. PLEASE ADDRESS THE COMPANY’S ASSESSMENT OF DEMAND-SIDE  
17 RESOURCE POTENTIAL.

18 A. In Order No. 24,695, the Commission directed the Company to conduct a  
19 systematic evaluation of reasonably available demand-side resources. In response  
20 to that directive, the Company began its demand-side assessment with what it  
21 termed as “an assessment of the available demand side potential.” A careful  
22 review of the filing reveals, however, that the Company did not in fact assess the  
23 potential for demand-side resources in its service territory. To conduct such an

---

<sup>2</sup> PSNH used the Total Resource Cost test to determine cost-effectiveness.

1 assessment would require an end-use breakdown of electric consumption, data on  
2 the penetration and saturation of energy efficiency equipment in each end-use  
3 sector, and knowledge of the currently available and soon to be commercially  
4 available technologies which could play a part in future energy efficiency  
5 programs including estimates of usage per customer and savings. None of these  
6 issues is addressed in the LCIRP. Instead, the Company developed several so-  
7 called benchmarks that it claims “can be employed to assess the resource potential  
8 of DSM activities” such as the energy and peak demand savings that would result  
9 under: (i) a no load growth strategy; (ii) the assumption that DSM funding would  
10 continue at its current level through the end of the planning period; or (iii) the  
11 assumption that DSM funding would be expanded to say 3 mills/kWh. The  
12 results of these estimates, which are summarized at Exhibits IV-3 & 5 of the  
13 LCIRP, would better be described as DSM goals/targets rather than DSM  
14 potential. Accordingly, Staff believes that the Company’s estimates on the  
15 potential for demand-side resources should be disregarded. For its next LCIRP,  
16 Staff recommends that the Company use information from the report to be filed  
17 by the consultants hired in response to the Commission’s RFP - Evaluating  
18 Additional Opportunities for Energy Efficiency in New Hampshire.

1 Demand Response Programs

2 Q. THE COMPANY EXAMINED A NUMBER OF PROGRAM OPTIONS FOR  
3 POSSIBLE INCLUSION IN AN EXPANDED SET OF PROGRAM  
4 OFFERINGS THAT WOULD FILL SOME OF THE RESOURCE BALANCE  
5 INCLUDING COOL STORAGE AND DEMAND RESPONSE. WHAT  
6 CONCLUSIONS DID THE COMPANY REACH REGARDING THESE  
7 OPTIONS?

8 A. PSNH concluded that cool storage technology is not cost effective in New  
9 Hampshire in part due to the cool climate and in part due to the lack of price  
10 differentiation in retail rate structures.

11 As for demand response, PSNH analyzed two incentive scenarios: (i) a \$80/kW-yr  
12 customer incentive; and (ii) a \$40/kW-yr customer incentive payment that  
13 approximately corresponds to the current ISO-NE capacity transition payment.<sup>3</sup>

14 Under the \$80/kW-yr customer incentive, PSNH concluded that demand response  
15 would not be cost-effective until 2011, when the full value of new capacity is  
16 projected to be reflected in the Forward Capacity Market. Even then, the  
17 Company found that the option is just barely cost-effective. Under the \$40/kw-yr  
18 customer incentive, demand response was estimated to be marginally cost-  
19 effective in 2009 and strongly cost-effective in 2011. For these reasons, PSNH  
20 recommended that demand response not be implemented at this time and instead  
21 the economics of this option be reviewed again in the next LCIRP.

---

<sup>3</sup> Other program costs include metering and communications infrastructure costs, Internet Based Communications System contractor fees, and administrative costs.

1 Q. IS STAFF SURPRISED BY THIS RECOMMENDATION?

2 A. Yes, the recommendation appears to conflict with the results of the Company's  
3 economic analysis of peaking units which is included in its supply-side  
4 assessment. In that analysis, the Company concluded that installation of a  
5 peaking unit would produce significant cost savings for customers (primarily in  
6 the form of avoided Forward Capacity Market payments) over the life of the unit.  
7 Although the analysis indicates costs exceed benefits in the early years, the  
8 Company appears to believe that installing the unit in 2010 would be in the public  
9 interest. In contrast, the Company believes that paying participating customers to  
10 reduce peak period demands in 2010 (so that all customers can benefit from  
11 essentially the same ISO-NE savings generated by the peaking unit) is not in the  
12 public interest even though the program was determined to be cost effective in  
13 that year (if only marginally) and cost effectiveness was projected to improve  
14 significantly over time.

15 Q. DOES STAFF ACCEPT THAT DEMAND RESPONSE IS ONLY  
16 marginally cost effective in 2010?

17 A. No, for several reasons. First, PSNH assumed that program participation requires  
18 each customer to incur an incremental metering cost. However, the customers  
19 most likely to benefit from this program are large C&I customers who already  
20 have real-time meters installed. Consequently, the incremental metering cost  
21 under the program should be zero.

22 Second, PSNH assumed that transmission costs would not be avoided. Although  
23 the primary benefit of demand reductions under an ISO-NE sponsored demand

1 response programs is the avoidance of Forward Capacity Market payments, such  
2 demand reductions are also likely to lower PSNH's transmission expense under  
3 its service agreements with ISO-NE and NU. These costs savings should have  
4 been incorporated into the analysis.

5 Third, demand reductions under the program are also likely to produce savings in  
6 distribution system reinforcement costs even though distribution system peak  
7 demands are not fully coincident with generation/transmission system peak  
8 demands. These investment cost savings should have been estimated and  
9 included in the analysis.

10 Fourth, PSNH provided no support for its assumption that an administrative cost  
11 of \$5,000 per participant would be incurred. Even if such costs are incurred,  
12 PSNH has not shown that they would be incremental and therefore includable in  
13 the analysis.

14 Q. WHAT DOES STAFF RECOMMEND?

15 A. Staff recommends that the Company undertake a more detailed assessment of  
16 demand response programs taking into account the above comments. Based on  
17 the results of that assessment, the Company should recommend to the  
18 Commission whether the public interest would be served by offering such a  
19 program to large customers immediately.

1 Energy Efficiency Programs

2 Q. PSNH CLAIMS THAT IT USED THE TOTAL RESOURCE COST (TRC)  
3 TEST TO DETERMINE THE COST EFFECTIVENESS OF ENERGY  
4 EFFICIENCY PROGRAMS. IS THE EXECUTION OF THIS TEST  
5 CONSISTENT WITH COMMISSION POLICY?

6 A. No, the Company included a 15% benefits adder in the TRC Test to reflect “non-  
7 quantified benefits,” which it describes as the “environmental and other benefits”  
8 associated with reduced energy usage.<sup>4</sup> This practice is contrary to the  
9 Commission’s policy of not incorporating monetized environmental externality  
10 values in avoided cost analyses, which was recently re-affirmed in Order No.  
11 24,695 in the section addressing PSNH’s demand-side resource assessment.

12 Q. DID THE COMPANY INCLUDE THE 15% ADDER TO CAPTURE SOON-  
13 TO-BE INTERNALIZED ENVIRONMENTAL BENEFITS SUCH AS  
14 REDUCED CO2 EMISSIONS?

15 A. While that may have been the Company’s intent, Staff is not certain because the  
16 term “environmental and other benefits” is not defined in the LCIRP. Staff does  
17 not believe, however, that the adder is intended to reflect the benefits of reduced  
18 CO2 emissions since those benefits are captured in the Company’s avoided  
19 energy cost estimates.

---

<sup>4</sup> The Societal test is the name given to the TRC test with environmental externalities included.

1 Q. DOES STAFF HAVE OTHER CONCERNS WITH THE COMPANY'S  
2 EXECUTION OF THE TEST?

3 A. Yes. Although the test appropriately measures the costs and benefits of programs  
4 from the standpoint of both utility and participating customer, the Company has  
5 included participant benefits not typically included. These benefits are labeled  
6 "quantifiable resource savings" and relate apparently to non-electric bill savings,  
7 such as reduced water and gas (natural gas or propane) usage, associated with  
8 reductions in energy usage. While Staff is not familiar with energy efficiency  
9 programs that produce such secondary bill savings, it nevertheless believes that  
10 treating those savings as benefits in the TRC test is unreasonable. This is because  
11 the inclusion in the test of non-electric bill savings of participant customers has  
12 the effect of lowering the cost effectiveness bar but provides no offsetting benefits  
13 to non-participants. In other words, it turns programs that were previously  
14 marginally uneconomic into economic programs without any increase in benefits  
15 for those customers that pay the program costs.

16 Cost Effectiveness Tests

17 Q. THE COMMISSION IN ORDER NO. 24,695 DIRECTED PSNH TO  
18 UNDERTAKE A STUDY TO DETERMINE THE EFFECTS OF USING THE  
19 RATE IMPACT TEST (RIM) ON DSM RESOURCE AVAILABILITY. WHAT  
20 WAS THE STUDY'S CONCLUSION?

21 A. In order to determine the impact of not adopting the RIM test on the availability  
22 of demand side resources, PSNH applied the RIM test to the three most cost-  
23 effective DSM programs as determined by the TRC test. None of these programs

1 passed the test, according to PSNH. Based on this result, the Company concluded  
2 that using the RIM test would disqualify many of the programs that have been  
3 determined to be cost effective under the TRC test and, therefore, lower the  
4 availability of demand-side resources. On the other hand, using the RIM test  
5 would ensure that no non-participating customer would be called on to subsidize  
6 the benefits participants derive from utility delivered programs.

7 Q. WHAT DO YOU RECOMMEND?

8 A. Staff recommends that the Company revise its TRC test to exclude both the 15%  
9 adder for non-quantified benefits and the component labeled “quantifiable  
10 resource savings.” These changes will reduce the rate impact of energy efficiency  
11 programs experienced by non-participating customers.

12 **IV. ASSESSMENT OF SUPPLY-SIDE OPTIONS**

13 Q. DO YOU HAVE CONCERNS REGARDING THE COMPANY’S SUPPLY-  
14 SIDE ASSESSMENT?

15 A. Yes, Staff believes that the assessment is deficient in two important respects.  
16 The first relates to the generic cost information included in the LCIRP regarding  
17 the construction or acquisition of new generation options. The second relates to  
18 the omission of any discussion of whether continued operation of PSNH’s  
19 existing generating stations, particularly Merrimack, is in the public interest.

20 Generic Cost Information

21 Q. WHAT IS THE BACKGROUND TO THE FIRST ISSUE?

22 A. Even though legislative approval would be required before PSNH could build or  
23 buy new generation, the Commission in Order No. 24,695 directed that generic

1 cost information relating to new generation options be included in the Company's  
2 next integrated resource plan "so that an informed decision could be made by the  
3 Commission or the Legislature regarding whether the public interest would be  
4 served by authorizing PSNH to acquire new generation." The cost information  
5 included in the LCIRP relates to a 50 MW wood-fired power plant, 20-25 MW  
6 peaking units, and small scale renewable (solar and wind) generators. Other  
7 generation options such as new nuclear or new coal-fired capacity were rejected  
8 by PSNH for several reasons including perceived permitting difficulties and  
9 financial risks. A combined cycle natural gas-fired power plant was also rejected  
10 because PSNH believed such generation is unlikely to produce significant cost  
11 savings relative the market purchases.

12 Q. DOES STAFF AGREE THAT IT WOULD BE FUTILE TO INVESTIGATE  
13 THE NUCLEAR AND COAL-FIRED PLANT OPTIONS?

14 A. Staff believes that the Legislature is unlikely to be persuaded to consider siting a  
15 new nuclear facility in the state, despite the favorable economics of nuclear  
16 technology. Thus, Staff supports the Company's decision to remove that option  
17 from consideration. Staff, however, is less certain about the decision not to  
18 investigate the economics of coal-fired generation. This option was rejected on  
19 the ground that the minimum size for this type of plant is 600 MW, which would  
20 exceed PSNH's off-peak load requirement. However, the Company failed to  
21 consider the possibility of joint ownership with other generators or the sale of  
22 surplus output into the wholesale market. That said, Staff acknowledges that the

1 cost of compliance with stringent emissions regulations (mercury and CO2) is  
2 likely to make this option far less cost effective in the future than today.

3 Q. WHAT CONCLUSIONS DID THE COMPANY DRAW FROM THE GENERIC  
4 COST INFORMATION?

5 A. As required by the Commission in Order No. 24,695, the Company calculated and  
6 presented the revenue requirements for each generation option, net of offsetting  
7 revenues, and compared the resulting present value to the present value of  
8 equivalent market purchases. Based on these analyses, the Company concluded  
9 that new biomass, peaking and wind power generation facilities would be cost  
10 effective relative to market purchases. Solar photovoltaic ("PV") generation was  
11 also determined to be cost effective provided federal legislation was passed that  
12 continued the Business Energy Tax Credit ("BETC") past 2008 and extended it to  
13 electric utility companies for solar PV installations. Absent such legislation, the  
14 Company concluded that solar PV is unlikely to be cost effective even with  
15 renewable energy credits (RECs) that are assumed to increase in value over the 20  
16 year life of the installation.

17 Despite these conclusions, PSNH's best estimate of the capacity that could  
18 reasonably be added to its system within the five year planning horizon is 142  
19 MW, comprising one 50 MW biomass plant facility, three 20 MW peaking units,  
20 5 MW of solar PV installations, and 27 MW of wind generation.<sup>5</sup> This would still  
21 leave an on-peak capacity deficiency of over 700 MW to be met with market  
22 purchases.

---

<sup>5</sup> The estimate assumes that legislation would be passed that authorized the construction or acquisition of new generation capacity. Note that the solar PV and wind power capacities have been de-rated.

1 Q. DID THE COMPANY ALSO RANK THE GENERATION OPTIONS AS  
2 REQUIRED BY ORDER NO. 24,695?

3 A. Yes, the options were ranked but not based on the method specified in the  
4 Commission's order. The Company used a weighted system that included the  
5 following criteria:

- 6 1. Net revenue requirements;
- 7 2. Environmental compliance costs;
- 8 3. Fuel diversity;
- 9 4. Availability at time of system peak; and
- 10 5. Promotion of price stability.

11  
12 Each criterion was assigned a weight based on PSNH's subjective determination  
13 of its value to customers. Net revenue requirements was assigned a weight of 0.3,  
14 environmental compliance costs 0.2, fuel diversity 0.15, availability at time of  
15 system peak 0.15, and promotion of price stability 0.2.

16 Q. WHAT WAS THE RESULT OF THE COMPANY'S RANKING ANALYSIS?

17 A. The Company ranked wind and solar PV panels (with BETC) first, biomass  
18 second, peaking units third, and solar photovoltaic panels (without BETC) fourth.

1 Q. PLEASE EXPLAIN WHY YOU BELIEVE THE COMPANY WAS WRONG  
2 TO INCLUDE THE ABOVE MENTIONED CRITERIA IN ITS RANKING  
3 SYSTEM WHEN ORDER NO. 24,695 STATES THAT THOSE CRITERIA  
4 SHOULD BE TAKEN INTO ACCOUNT WHEN EVALUATING SUPPLY-  
5 SIDE OPTIONS?

6 A. The Commission's order at page 25 is clear that the options should be ranked  
7 based on their net revenue requirements relative to the cost of market purchases.  
8 Staff believes that the Commission intended the other criteria be taken into  
9 account only when two or more options had the same or similar relative net  
10 revenue requirements.

11 Q. DOES STAFF HAVE CONCERNS WITH THE RANKING ANALYSIS OR  
12 THE REVENUE REQUIREMENTS ANALYSES THAT UNDERLIE THAT  
13 ANALYSIS?

14 A. Staff has concerns with both.

15 Q LEAVING ASIDE THE SUBJECTIVE NATURE OF THE COMPANY'S  
16 RANKING ANALYSIS, PLEASE OUTLINE SOME OF STAFF'S  
17 CONCERNS.

18 A. As noted above, the net revenue requirements criterion received the highest  
19 weighting at 30% followed by environmental compliance costs and price stability  
20 at 20%. The value to customers, however, of low environmental emissions is  
21 already reflected in the net revenue requirements estimates for the biomass, solar  
22 PV and wind generation options through the inclusion of REC revenues in the

1 calculation.<sup>6</sup> Thus, inclusion of an environmental compliance cost criterion in  
2 the ranking analysis would amount to double counting of this attribute. In fact, it  
3 could be argued that it would amount to triple counting for solar PV since the  
4 revenue requirements for that technology include the BETC, whose purpose is to  
5 promote the use of technologies that do less harm to the environment.

6 The same argument would apply to the availability at system peak criterion  
7 because generation options that have high availability at system peak receive  
8 higher forward capacity market payments than options with low availability at  
9 system peak. Since these higher payments result in lower net revenue  
10 requirements, it would be double counting to include this attribute in the ranking  
11 analysis.

12 Q. IS THERE A MORE BASIC CONCERN WITH THE RANKING ANALYSIS?

13 A. Yes. The Company is attempting to rank generation projects that have totally  
14 different roles in PSNH's generation system. The biomass plant, for example,  
15 operates in the base load mode with an annual capacity factor of 90%. The  
16 peaking units, in contrast, have annual capacity factors of 1.5% and operate (as  
17 the name suggests) as peak shaving plants. Thus, the fuel-related revenue  
18 requirements for these dissimilar plant types will be different simply because they  
19 play different roles within PSNH's generation system. In addition, the biomass  
20 plant has a capacity of 50 MW whereas each peaking unit is only 21 MW, a fact  
21 that is guaranteed to produce different non-fuel related revenue requirements.

---

<sup>6</sup> While REC revenues may not reflect the true value customers place on low emissions, there can be little doubt that their inclusion makes renewable technologies more cost effective.

1 The point is that unadjusted net revenue requirements cannot logically be the  
2 basis on which projects that serve different purposes or differ in size are selected.  
3 While the latter problem can be resolved by calculating per unit revenue  
4 requirements, the problem of choosing between base load and peak shaving  
5 projects requires a different solution. Specifically, the Company should have  
6 calculated for each project the ratio of net revenue requirements to market  
7 purchases, with both quantities expressed in net present value terms. All projects  
8 with ratios less than one would be deemed economic relative to market purchases.  
9 Those with lower ratios would be viewed as having greater value to customers per  
10 dollar of expenditure than those with higher ratios.

11 Q. WHAT ARE STAFF'S SPECIFIC CONCERNS WITH THE REVENUE  
12 REQUIREMENTS ANALYSES?

13 A. Staff's first concern relates to the absence of transmission costs in the revenue  
14 requirements estimates for wind and biomass power plants despite the fact that  
15 such generators are likely to be located in the northern part of the state (where the  
16 wind blows strongly and wood fuel is plentiful) in an area where the existing  
17 transmission infrastructure needs to be upgraded or replaced before significant  
18 amounts of new generation can be connected to the system. The cost to upgrade  
19 the northern New Hampshire transmission system to accommodate additional  
20 generation has been estimated at \$210 million or between \$525/kW and \$700/kW.  
21 At the top end of this cost range, a 50 MW biomass plant could be responsible for  
22 an additional \$35 million and potentially much more depending on the

1 methodology used to allocate transmission costs and the plant's position in the  
2 queue. Clearly, this is not an insignificant omission when compared to the \$ [REDACTED]  
3 million estimated capital cost of the plant.

4 Q. WOULD STAFF'S CONCERN ABOUT THE HIGH COST OF  
5 TRANSMISSION UPGRADES BE ADDRESSED BY USING THE  
6 PROCEEDS FROM THE SALE OF RENEWABLE ENERGY CREDITS TO  
7 FINANCE THAT EXPANSION?

8 A. No, the issue is not how to finance the expansion but rather whether the expansion  
9 is cost effective. If revenues from the sale of RECs are used to pay for the  
10 expansion, they will not be available to offset the otherwise uneconomic cost of  
11 wind and/or biomass generation.

12 Q. PLEASE DISCUSS STAFF'S OTHER CONCERNS.

13 A. Staff has several additional concerns. For example, the revenue requirements for  
14 the new biomass plant do not include the cost of land or reflect the need for  
15 capital additions to maintain efficient and reliable operations.<sup>7</sup> In addition, while  
16 the Company appropriately adjusted the capital cost of the plant estimated by  
17 R.W. Beck to recover costs not included in that estimate, the adjustment was  
18 made without the aid of a detailed cost analysis. Further, the Company assumed  
19 that the cost of biomass fuel would remain at \$30/ton, the fuel price at the time of

---

<sup>7</sup> The capital cost estimate for the biomass plant is based on work done by R.W. Beck under contract to PSNH. Beck's estimate, however, does not include taxes, licensing fees, and owners costs (such as land, management and administration costs, PSNH's contingency, AFUDC, legal fees, development costs, financing costs, and interconnection costs).

1 the filing. Stated differently, the cost of biomass fuel is expected to decline in  
2 real terms over the life of the plant; an assumption that was made without the aid  
3 of studies of the future supply and demand for biomass fuel in New Hampshire or  
4 the effect higher transportation costs may have on the delivered price of fuel.

5 Thus, the omission of transmission costs, land costs and capital additions, plus the  
6 questionable assumption that the cost of fuel will decline in real terms over the  
7 long term, results in revenue requirements estimates that Staff believes are  
8 unreasonably low and make the biomass option appear more cost effective than it  
9 really is.

10 Q. DO THE REVENUE REQUIREMENTS ESTIMATES FOR THE BIOMASS  
11 PLANT INCLUDE ENVIRONMENTAL COMPLIANCE COSTS?

12 A. Even though R.W. Beck determined that the [REDACTED]  
13 [REDACTED]  
14 [REDACTED]  
15 [REDACTED] it appears that the capital and operating costs associated  
16 with such equipment are not included in the revenue requirements.<sup>8</sup> Staff notes,  
17 however, that biomass plants are considered carbon neutral and therefore are not  
18 subject to the requirements of CO2 emissions regulations. Accordingly, the  
19 revenue requirements estimates should exclude the CO2 compliance costs, which  
20 is the case with the Company's estimates.

---

<sup>8</sup> See Exhibit GRM 2 - PSNH Response to Staff 1-34.

1 Q. DOES STAFF HAVE ANY CONCERNS ABOUT THE REVENUE  
2 REQUIREMENTS ESTIMATES FOR THE PEAKING UNITS?

3 A. Yes. As with the price of biomass fuel, PSNH has assumed that the price of jet  
4 fuel for a peaking unit will remain constant throughout the life of the unit. Given  
5 the recent upward pressure on the price of oil, this assumption seems particularly  
6 unrealistic and at odds with the assumption that market energy prices will increase  
7 at the rate of inflation through 2040.

8 In addition, the Company assumed that annual fuel costs of \$415,000 would be  
9 fully offset by energy market revenues from the sale of the output. However,  
10 under the scenario in which the output from the peaking unit is replaced with  
11 market purchases, the Company estimated that energy market costs would be  
12 approximately half the fuel costs. This suggests that the fuel-related component  
13 of the peaking unit revenue requirements is understated.

14 As regards non-fuel revenue requirements, Staff notes that the Company excluded  
15 the cost of land and the need for capital additions to maintain efficient and reliable  
16 operations.

17 Q. DOES STAFF ALSO HAVE CONCERNS ABOUT THE REVENUE  
18 REQUIREMENTS ESTIMATES FOR SOLAR PV PROJECTS?

19 A. Yes, Staff questions the optimism expressed in the LCIRP regarding solar PV  
20 panels. For example, even though the BETC is due to expire at the end of 2008,  
21 and is not currently available to utility companies, PSNH elected to include this

1 tax credit in one scenario thus making utility ownership appear more cost  
2 effective than it really is.

3 Q. IS IT POSSIBLE THAT THE BETC WILL CONTINUE BEYOND 2008 AND  
4 BE EXPANDED TO COVER UTILITY COMPANIES?

5 A. While it is possible, it is important to note that a proposal before the United States  
6 House to achieve those ends was stripped from a larger bill and therefore did not  
7 move forward.<sup>9</sup> For this reason, Staff believes the Company was not justified in  
8 including this assumption in its analysis.

9  
10 Q. DID THE COMPANY TAKE INTO ACCOUNT O&M EXPENSES IN ITS  
11 ECONOMIC ANALYSIS OF SOLAR PV?

12 A. No, O&M expenses were excluded from the revenue requirements calculations.

13 Q. DOES THE COMPANY'S OPTIMISM ABOUT SOLAR PV CONTRAST  
14 WITH THE VIEWS OF RENEWABLE ENERGY EXPERTS?

15 A. Yes. A recent study<sup>10</sup> conducted by Severin Borenstein, a professor at Berkeley's  
16 Haas School of Business and Director of the University of California Energy  
17 Institute, concluded that the costs of solar PV in the United States "far outweigh  
18 the benefits." Under the most extreme assumptions (such as a 5% annual increase  
19 in electricity costs and a 1% interest rate on money borrowed), Borenstein found  
20 that "the cost of solar PV is about 80% greater than the value of the electricity it

---

<sup>9</sup> See Exhibit GRM-3 - PSNH Response to Staff 1-44.

<sup>10</sup> The Market Value and Cost of Solar Photovoltaic Electricity Production,

1 will produce.” Under more likely assumptions about electricity costs and interest  
2 rates, Borenstein found that “the cost of a solar PV installation today is three to  
3 four times greater than the benefits of the electricity it will produce.” The gap is  
4 so large that including current plausible estimates of the value of reducing  
5 greenhouse gases does not make the current solar PV technology a worthwhile  
6 investment, Borenstein said.

7 Q. DOES BORENSTEIN’S STUDY TAKE INTO ACCOUNT FEDERAL TAX  
8 CREDITS AND STATE REBATES AND SUBSIDIES?

9 A. No, the Borenstein study analyzed the social value of solar PV rather than the  
10 private value. Thus, to the extent that a utility owner of solar PV facilities  
11 qualifies for a federal or state subsidy, the value of ownership would be greater  
12 than that calculated by Borenstein.

13 Q. DID PSNH CALCULATE THE PRIVATE VALUE OF OWNING SOLAR PV  
14 FACILITIES?

15 A. Yes, it concluded that even if solar PV is eligible for RECs that increase in value  
16 over the life of the installation it would still not be grid competitive if the BETC is  
17 not continued beyond 2008 and not extended to public utilities. Given that neither  
18 of these legislative results appears imminent, it is difficult to understand why  
19 PSNH would want to promote interest in solar technologies at this time.

1 Wholesale Price Forecast

2 Q. FOR EACH GENERATION OPTION, PSNH DETERMINED COST  
3 EFFECTIVENESS BY COMPARING THE ESTIMATED REVENUE  
4 REQUIREMENTS WITH THE COST OF WHOLESale ENERGY AND  
5 CAPACITY PURCHASES OVER THE OPTION'S LIFE. DOES STAFF  
6 HAVE ANY CONCERNS WITH THE QUALITY OF THE ENERGY AND  
7 CAPACITY COST PROJECTIONS?

8 A. Staff has several concerns with the methodology used to develop the long-term  
9 forecast of market energy prices. PSNH's reference or base forecast is based on a  
10 combination of forward natural gas prices provided by a broker and natural gas  
11 prices estimated by the firm EVA using fundamentals analysis. Both sets of  
12 prices cover the period 2008 through 2012 and the forward prices are for delivery  
13 to Transcontinental Gas Pipeline Company (Transco) located in New York  
14 (known as Zone 6-NY). After converting both sets of gas prices to electrical  
15 energy prices using estimated market heat rates, the Company calculated a  
16 combined set of prices that consist of an equal weighing of the two price sets.  
17 Market energy prices subsequent to 2012 were then calculated by escalating the  
18 2012 prices at the Consumer Price Index (CPI). As the Company notes in its  
19 filing, Zone 6-NY is outside of ISO-NE and, therefore, not a perfect location for  
20 approximating the future price of gas to ISO-NE generators. That fact  
21 notwithstanding, the Company claims that Zone 6-NY is "the only nearby  
22 location traded at NYMEX and generally correlates with basis pricing into New  
23 England." Staff disagrees with this claim, noting that significant quantities of

1 natural gas are delivered to New England hubs including Dracut, Massachusetts  
2 under NYMEX contracts. Further, 2008 data for Dracut indicate that average  
3 prices are lower at Dracut compared to Zone 6-NY by almost \$0.60 per Dth. This  
4 information suggests that the Company's projection of market energy prices may  
5 be higher than it ought to be.

6 Staff is also concerned about the assumption that market energy prices will  
7 increase outside the 5 year planning horizon at the rate of inflation. This  
8 assumption is not based on any meaningful analysis and, therefore, is not a  
9 reasonable basis on which to conduct investment planning.

10 Long-term forecasts of wholesale market energy prices are usually developed  
11 using a production cost simulation model that takes into account anticipated  
12 changes in the key drivers of future prices. The most important drivers for the  
13 New England market are: (i) expectations for natural gas prices; (ii) projected  
14 growth in the demand for electricity (particularly during peak hours); and (iii) the  
15 amount of new generation expected to come on line, net of retirements. Without  
16 an in-depth analysis of these and other market drivers, there can be little  
17 confidence that the long-term forecast of energy prices is reasonable and provides  
18 a sound basis for the revenue requirements analyses.

19 Finally, Staff questions the reasonableness of the Company's long-term forecast  
20 of capacity prices. In the first year following the transition period (2010), the  
21 Company assumed the auction clearing price would equal \$7.5/kW-month, the  
22 levelized cost of a new peaking facility. Thereafter, capacity prices were assumed  
23 to escalate at an annual rate of 2.1%. Staff's concern is twofold. First, the

1 \$7.5/kW-month figure has been shown to be not reasonable by the outcome of the  
2 first FCA, which resulted in a 2010 price of \$4.5/kW-month. This outcome has  
3 been attributed to the large amount of new demand resources that cleared in the  
4 FCA, a result that was predicted in modeling by the New England Demand  
5 Response Initiative.

6 Second, the assumption that capacity prices will increase after 2011 at the annual  
7 rate of 2.1% was not based on any meaningful analysis and, therefore, is of  
8 questionable value.

9 Continued Unit Operation Studies

10 Q. EARLIER YOU SAID THAT STAFF IS CONCERNED ABOUT THE  
11 COMPANY'S FAILURE TO CONDUCT CONTINUED UNIT OPERATION  
12 (CUO) STUDIES OF THE MERRIMACK UNITS. WHAT IS A CUO STUDY?

13 A. A CUO study analyzes the economic value to customers of continuing to operate  
14 a unit under expected future market and operating conditions.

15 Q. WHAT IS THE BACKGROUND TO THIS ISSUE?

16 A. The background is the Commission's order in Docket DE 04-072, which  
17 approved a partial settlement agreement in that docket. The order states in  
18 relevant part that PSNH would: (i) discuss and evaluate in its next LCIRP  
19 alternatives for complying with potential state and federal mercury emissions  
20 regulations; and (ii) quantify the potential rate impacts of its compliance plan.  
21 As regards the first requirement, PSNH stated that subsequent to the partial  
22 settlement, the Legislature enacted 2006 N.H. Laws, Chapter 105 (HB 1673),  
23 "AN ACT relative to the reduction of mercury emissions." The result of this law,

1 according to PSNH, is that the Legislature has mandated the installation of a wet  
2 flue gas desulphurization system at Merrimack Station and, therefore, no other  
3 reasonable alternative is legally available. See, RSA 125-O:11-18 (2006)

4 As regards the second requirement, PSNH states that it is not currently able to  
5 quantify the potential rate impact of its mercury compliance plan, that is, the  
6 installation of a scrubber at Merrimack. It went on to say that the rate impact will  
7 ultimately be determined by the capital cost of the scrubber system and the  
8 associated increased O&M costs, less cost savings associated with reduced SO2  
9 emissions.

10 Q. DOES STAFF AGREE THAT THE LEGISLATURE MANDATED THE  
11 INSTALLATION OF A WET FLUE GAS DESULPHURIZATION SYSTEM  
12 AT MERRIMACK?

13 A. No. Even though the Legislature did find that installation of scrubber technology  
14 at Merrimack is in the public interest, Staff does not interpret RSA 125-O:11-18  
15 as mandating installation regardless of economics. That is, Staff does not believe  
16 that the Legislature intended scrubbers be installed if the resulting production cost  
17 is expected to exceed the cost of retiring the plant and replacing the lost output  
18 with market purchases.<sup>11</sup>

---

<sup>11</sup> Note that plant retirement is an alternate way of achieving the mercury emissions reductions.

1 Q. DOES THE FACT THAT THE COMPANY IS NOT CURRENTLY IN A  
2 POSITION TO QUANTIFY THE RATE IMPACT OF ITS MERCURY  
3 COMPLIANCE PLAN EXPOSE CUSTOMERS TO SIGNIFICANT COST  
4 RISKS?

5 A. Yes, it does. In response to discovery<sup>12</sup>, the Company stated that it “has already  
6 begun the scrubber project at Merrimack and has selected a project manager and  
7 issued requests for proposals for the major components of the project. Site work  
8 is expected to begin toward the end of 2008.” Absent CUO studies for the  
9 Merrimack units, PSNH runs the risk that the incremental costs to install and  
10 operate<sup>13</sup> the scrubber, less SO2 allowance savings, could make Merrimack  
11 Station operation uneconomic relative to market purchases. Given the large size  
12 of the scrubber capital investment (estimated in 2005 at \$250 million) plus the  
13 potential for increased operating costs, Staff believes that the prudent approach  
14 would be for PSNH to conduct a CUO study for Merrimack prior to making any  
15 final commitment to the scrubber project.

16 Q. IS THERE ALSO A NEED TO CONDUCT A CONTINUED UNIT  
17 OPERATION STUDY OF THE NEWINGTON STATION?

18 A. The Company states in the LCIRP that a recent economic review of Newington  
19 operation relative to market purchases indicates customer savings during on-peak  
20 hours in the months of January, February, July and August. That conclusion,  
21 however, was based on a fuel oil price of \$██████, which Staff understands to be  
22 the cost of fuel oil in inventory. This cost is substantially below the current price

---

<sup>12</sup> See Exhibit GRM-4 – PSNH Response to Staff 1-02.  
<sup>13</sup> Including replacement power costs if scrubber operation reduces the power output of Merrimack.

1 of fuel oil, which is approximately \$90/bbl for 1% sulfur content. Since historic  
2 prices have no place an economic analysis of future operations, Staff recommends  
3 that PSNH conduct a CUO study for the Newington Station that is based on the  
4 forward price of fuel oil.<sup>14</sup>

5 Q. DOES THAT CONCLUDE YOUR TESTIMONY?

6 A. Yes.

7

8

---

<sup>14</sup> If PSNH anticipates utilizing natural gas at Newington, the appropriate price to use in the study would be the forward price for natural gas at Dracut.
