>> ### 22 CLEC related incidents were deployed on 4/22.

>> ### Regression feedback received for 2 related items:

Incident ID	Incident Summary	Regression Feedback	IT comments
14919	New logic to support pre qualification on CLEC for DSL through a collocation. If the LC field is populated on the response, the end user location is served behind a remote terminal. If there is no LC field populated, the address is served by the Central Office.	Only an 8 character CLLI code was provided.	This is returning as designed. The business requirements indicated that the 8 char CLLI would be returned.
16070	Add the Remote Terminal CLLI to the LQS view to support the return of this field on the loop qual pre-order to indicate the address is served behind a RT.	Loop qual for a TN should have returned an LC field to indicate a remote terminal but it did not.	The address associated to the TN did not have a CLLI code populated in the LQS view. The system is working as designed but this is a data issue.
